

Python Coding

<https://pellcorp.github.io/coding/docs/python-coding.pdf>

What is Python

- A programming language which is very popular, especially for beginners.
- We are going to learn by doing, including playing with and changing sample code.
- What are we going to do:
 - Output – printing to the console
 - Variables
 - Conditional Statements
 - Loops

Python - Variables

- Strings
 - “Hello World”
- Whole Numbers (ints)
 - Numbers without decimal points
- Decimal Numbers (floats)
 - Numbers with a decimal points.
- Booleans
 - True or False
 - Boolean arithmetic
- Lists
 - A way to group values into a structure, so that python can operate on them together, an example would be:

```
states = ['VIC', 'NSW', 'TAS', 'SA', 'NT', 'QLD', 'WA']
```
 - Don't worry too much about these, hopefully the sample lately will make a bit more sense

Python If Statements

- We are going to be playing with IF statements today, they look like this:

```
if <condition>:  
    statement
```

```
elif <condition>:  
    statement
```

```
else:  
    statement
```

- Don't worry too much about understanding it all, hopefully once we start hacking on the samples some of it will become a bit clearer.

Python If Statement Conditions

- A condition is something that evaluates to true or false, and example would be.
- A condition is of the format:
 - value or variable **<operator>** value or variable
- Condition **operators** include:
 - **==** equals
 - **!=** not equals
 - **>** greater than
 - **>=** greater than or equal
 - **<** less than
 - **<=** less than or equal
 - **in** value in a list or string.
 - **not in** value not in a list or string

Windows Terminal Tips

- In windows Terminal you can use the arrow keys

- The up and down arrows can be used to use previous commands
- The left and right arrows can be used to edit a command in place.
- The TAB key can be used for command completion.
- For instance, I want to change to the Documents folder, I can type **cd Do** and then the TAB key and CMD will complete the command for me
- CTRL key + V key can be used in Terminal to paste text you have previously copied

Save hello.py to H:\Documents

- Open Chrome or Edge
- Type **coding.pellcorp.com** into the location bar and hit the **Enter** key.
- Click on the **hello.py** link

[Back](#)

- [intro](#)
- [server](#)
- [turtle](#)
- [hello.py](#)

- Select all the code by using **CTRL** key and **A** key

- Copy the selected code by using **CTRL** key and **C** key

- Back to Notepad++
- Use **File** → **New** to open a new tab

- Paste the code into the new Notepad++ tab using **CTRL** key and **V** key

Save hello.py to H:\Documents Cont.

- Click File → Save As

- Save to **H:\Documents** folder with **hello.py** as the File name
- You should now see **H:\Documents\hello.py** at the top of Notepad++

Windows Terminal

- Remember Windows Terminal?
- **Windows** Key + **R** Key
- Then **cmd** and **Enter** key
- Change the drive letter to H: by typing **H:** and **Enter** key.
- Change to H:\Documents by typing **cd Documents** and **Enter** key

```
Command Prompt
Microsoft Windows [Version 10.0.19045.2130]
(c) Microsoft Corporation. All rights reserved.

C:\Users\user>H:

H:\>cd Documents

H:\Documents>_
```

Run hello.py

"C:\Program Files\Python37\python.exe" hello.py

Command Prompt

```
Microsoft Windows [Version 10.0.19045.2130]
(c) Microsoft Corporation. All rights reserved.

C:\Users\user>z:

H:\>cd Documents

H:\Documents>"C:\Program Files\Python37\python.exe" hello.py
hello

H:\Documents>_
```

Intro Python Samples

- Open Chrome or Edge
- Type **coding.pellcorp.com** into the location bar and hit the **Enter** key.
- Click on the **intro** link
- The samples should be displayed in your browser like this:

[Back](#)

- [intro](#)
- [server](#)
- [turtle](#)
- [hello.py](#)

[Back](#)

- [1-variables.py](#)
- [2-boolean-condition.py](#)
- [3-string-condition.py](#)
- [4-int-condition.py](#)
- [5-float-condition.py](#)
- [6-list-condition.py](#)
- [7-list-loop.py](#)

Save 1-variables.py to H:\Documents

- Open Chrome or Edge
- Type **coding.pellcorp.com** into the location bar and hit the **Enter** key.
- Click on the **1-variables.py** link

[Back](#)

- [1-variables.py](#)
- [2-boolean-condition.py](#)
- [3-string-condition.py](#)
- [4-int-condition.py](#)
- [5-float-condition.py](#)
- [6-list-condition.py](#)
- [7-list-loop.py](#)

```
im a boolean = True
im a string = 'Hello World'
im a int number = 3
im a float = 3.3
im a list = ['jason', 'thomas', 'zachary', 'ella', 'clair', 'lucy']
print(f'im a boolean: {im a boolean}')
print(f'im a string: {im a string}')
print(f'im a int number: {im a int number}')
print(f'im a float: {im a float}')
print(f'im a list: {im a list}')
```

- Back to Notepad++
- Use **File** → **New** to open a new tab

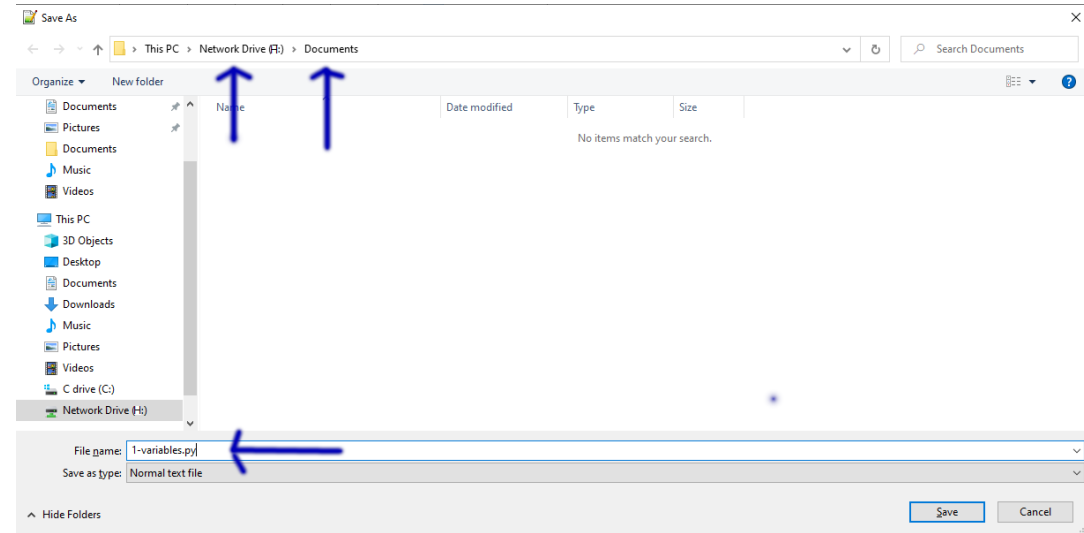

- Paste the code into the new Notepad++ tab using **CTRL** key and **V** key

- Select all the code by using **CTRL** key and **A** key
- Copy the selected code by using **CTRL** key and **C** key

Save 1-variables.py to H:\Documents Cont.

- Click File → Save As

- Save to **H:\Documents** folder with **hello.py** as the File name
- You should now see **H:\Documents\1-variables.py** at the top of Notepad++

Run 1-variables.py

"C:\Program Files\Python37\python.exe" 1-variables.py

```
Command Prompt
Microsoft Windows [Version 10.0.19045.2130]
(c) Microsoft Corporation. All rights reserved.

C:\Users\user>H:

H:\>cd Documents

H:\Documents>"C:\Program Files\Python37\python.exe" hello.py
hello

H:\Documents>"C:\Program Files\Python37\python.exe" 1-variables.py
im a boolean: True
im a string: Hello World
im a int number: 3
im a float: 3.3
im a list: ['jason', 'thomas', 'zachary', 'ella', 'clair', 'lucy']

H:\Documents>_
```

Save all the samples

- Repeat the steps for:
 - 2-boolean-condition.py
 - 3-string-condition.py
 - 4-int-condition.py
 - 5-float-condition.py
 - 6-list-condition.py

Exercises

- Hack the hello.py
 - Change the text that is printed from 'hello' to whatever you want, just be sure to keep the single quotes!
 - See what happens if you remove the quotes
- Run the 1-variables.py
 - See how each of the different types of variables is printed, change some of the text and rerun the command (remember the up arrow on your keyboard!)
- Hack the condition scripts:
 - 2-boolean-condition.py
 - 3-string-condition.py
 - 4-int-condition.py
 - 5-float-condition.py
 - 6-list-condition.py
- Change the code so that it prints different message(s) in elif and else statements.
- There are some bugs in the code, see if you can find them.
